

Engineered to Lead.

.080/.047 TO BOTTOM OF
"VEE" OF LAST FULL THREAD

Why is Tempest® able to do what others can't? Because we engineer from the inside out. Tempest believes there are few product designs or components that can't be improved upon. Acting on that belief, our innovations are changing industry expectations. Because of Tempest's advanced engineering, competitors are going back to the drawing board—and trying to catch up. Tempest leads modern aviation spark plug design with our fired-in suppressor resistor—others have since followed. Tempest spark plugs have a superior bright nickel finish and high alumina ceramic insulators with "Clean Collar" tips; these features result in longer service life and optimal performance. In oil filter design, Tempest leads the way with our proprietary internal magnetic secondary filtration system. Plus, Tempest's Spin-EZ® oil filter is an industry first—with its patent-pending non-stick seal technology. Forward-thinking differences like these set us apart and prove what others now know—Tempest is engineered to lead.
